Hash Calculation Now Includes Slice Metadata

Doug Winsby (<https://autocare.communifire.com/people/dougwinsby>)

5/31/2020

The first design of the hash function which creates a **sha1 value based on Slice content** did not include `slice_metadata`. My original thinking was that no grain changes meant no reason to sync.

After some thought, however, I've decided that **slice_metadata is content** and so should be included in the hash.

This means that a simple update of a reference date would be synced up. (We hope no publisher would do that, though!).

For those interested, here is the (altered) code to perform the hash:

```
// HashSlice returns a sha1 hash of all metadata and grains in a slice
func HashSlice(db orm.DB, sliceID uuid.UUID) (string, int, error) {
    var (
        ids []uuid.UUID
        b    bytes.Buffer
        meta sandpiper.MetaArray
    )

    var hash = func(meta sandpiper.MetaArray, ids []uuid.UUID) string {
        if len(meta) == 0 && len(ids) == 0 {
            return ""
        }
        for _, u := range ids {
            b.Write(u[:])
        }
        for _, m := range meta {
            b.WriteString(m.Key)
            b.WriteString(m.Value)
        }
        return fmt.Sprintf("%x", sha1.Sum(b.Bytes()))
    }

    // get slice metadata (sorted!)
    if err := db.Model(&meta).
        Where("slice_id = ?", sliceID).
        Order("key").
        Select(); err != nil {
        return "", 0, err
    }

    // get grain ids for the slice (sorted!)
    if err := db.Model().Table("grains").Column("id").
        Where("slice_id = ?", sliceID).
        Order("id").
        Select(&ids); err != nil {
        return "", 0, err
    }

    return hash(meta, ids), len(ids), nil
}
```

[hash \(/spaces/127/sandpiper/searchresults?keyword=%22hash%22&searchtags=1\)](/spaces/127/sandpiper/searchresults?keyword=%22hash%22&searchtags=1)

[sync \(/spaces/127/sandpiper/searchresults?keyword=%22sync%22&searchtags=1\)](/spaces/127/sandpiper/searchresults?keyword=%22sync%22&searchtags=1)
